Subject: RE: Youtube - Flash Encode

Chris,
There is a test file ready to send. You can find it at:
J:\track_videofiles\test_files\YouTube\

Enjoy,

Spence

P.S. I'd still like to have the conversation concerning Flash 8 vs. Flash 7 so we can scope the amount of work needed for each. Thanks.

Importance: High

Hi all,

We don't have a formalized spec sheet but encode all our videos in the following format (Flash7 FLV progressive stream):

Video resolution: 320x240 (4:3 aspect ratio). All videos that do not follow this format (e.g. 16:9 widescreen are letter-boxed to 4:3).
Video bitrate: 256 kb/s
Audio bitrate: 64 kb/s mono (mp3 format)
Max frame rate: 30 fps
Contrast: This is mostly subjective but videos with lower contrast tend to look better. You will probably want to experiment to find optimal levels for WMG videos.

Please let me know if this will suffice. If not, please let me know exactly what additional pieces of information your team needs and we can dig it up for you. Thanks.

Matt

Guys,

Have you been able to send the detailed specs yet?

Thanks,
chris

All,
I'm just looking for a more formal spec layout that calls out as many of
the details as possible. Things like frame size, peak video rate, etc.
Any extra detail is greatly appreciated.

Thanks,

Spence

Subject: Youtube - Flash Encode

Hi Guys,

We're going to be doing Flash encoding on your behalf. Below are the
technical specs we've received. Can you provide a more detailed technical
specification?

>From Chris Maxcy: We are using a Sorenson squeeze 4.1 encoder with the
bitrates set at 256 kbp/s for video and 64 kbp/s for audio, the framerate is
dependent on the original, source video.

I've copied in Spence Chrislu and Pat Kraus. They're our video experts and
will probably have some more detailed questions for you.

Thanks - and Happy Fourth of July!

chris
